The Append Edge

Complete LAA elimination

Anatomy agnostic

Simpler procedure

No device in the heart

No DRT

No leakage

A novel transcatheter LAA elimination system

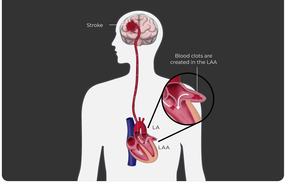
contact us

contact us

The clinical need is huge and growing

Millions
of patients worldwide suffer from Non-Valvular Atrial Fibrillation (NVAF), a life-threatening heart rhythm disease

X5
increased risk of stroke for NVAF patients



LAA - Left Atrial Appendage **LA** - Left Atrium AF - Atrial Fibrillation

LAA occlusion solutions aim to decrease stroke risks and are progressively replacing other stroke prevention therapies

DRT and PDL are inherent risks in current LAA occlusion solutions

Device Related Thromboembolism (DRT)
Caused by foreign material left in the LA increases risk of stroke **by 5 fold**

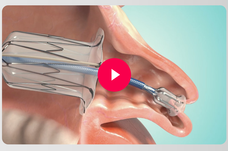
Peri Device Leakage (PDL)
Evidence shows even small leaks are significant and increase risk of stroke **by 2 fold**

The Append Transcatheter System

A sophisticated yet simple vacuum solution for inversion and ligation of the LAA tissue

Without implanting any device in the heart, Append is poised to disrupt the LAA occlusion market with a proprietary vacuum system, eradicating DRT and PDL risks while providing a transcatheter solution that universally fits the widest range of anatomies.

No device in the heart



Fits to the widest range of anatomies

Fast procedure

No DRT

No PDL
